

**PATENT**

Please amend the claims as follows:

1. (Previously Presented) A remote station apparatus comprising:  
a link quality estimation unit operative to generate a link quality estimate in response to a first power control instruction received on a common channel; and  
a power control unit coupled to the link quality estimation unit, the power control unit operative to generate a second power control instruction in response to the link quality estimate, wherein the second power control instruction is used to adjust the transmit power of the common channel at a base station.
2. (Original) The remote station apparatus of claim 1, wherein the remote station apparatus controls transmission power in response to the first power control instruction.
3. (Original) The remote station apparatus of claim 1, wherein the remote station apparatus transmits the second power control instruction.
4. (Previously Presented) A base station apparatus comprising:  
a decoder; and  
a determination unit coupled to the decoder, the determination unit operative to determine a received power control instruction for base station transmission on a common channel; and  
an adjustment unit coupled to the determination unit, the adjustment unit operative to adjust a transmission power level of the power control instruction.
5. (Previously Presented) A base station apparatus comprising:  
a control processor for power control of transmission of power control instructions on a common channel, wherein a transmission power level of the power control instruction is initially set to a reference value; and  
an amplifier operative to adjust a power level of the power control instructions.

## PATENT

6. (Original) A wireless communication system comprising:

a first power control unit operative to transmit reverse link power control instructions on a common channel; and

a second power control unit operative to adjust transmission power of the reverse link power control instructions in response to forward link power control instructions received on a reverse link.

7. (Previously Presented) A method for power control in a wireless apparatus operative in a communication system having a forward link and a reverse link, the system transmitting power control bits on a forward link common channel, the method comprising:

measuring a SNR of at least one power control bit for controlling a reverse link; and

determining a power control decision for the forward link based on the SNR, wherein the power control decision is used to adjust the transmit power of the common channel at a base station.

8. (Original) A method for power control in a wireless communication system, the system having a forward link and a reverse link, the system transmitting power control instructions on a forward link common channel, the method comprising:

determining a first power control instruction for control of the reverse link;

in response to receiving a second power control instruction on the reverse link, the second power control instruction for control of the forward link, determining a first transmission power level; and

transmitting the first power control instruction at the first transmission power level on the common channel.

9. (Previously Presented) A method for power control in a wireless communication system, the system having a forward link and a reverse link, the system transmitting power control instructions on a forward link common channel, the method comprising:

generating a reverse link power control instruction using a predetermined value;

**PATENT**

generating a forward link power control instruction; and  
adjusting a power level for transmission of the forward link power control instruction  
according to the reverse link power control instruction.

10. (Cancelled)

11. (Previously Presented) The base station apparatus of claim 4, wherein a transmission  
power level of the power control instruction is initially set to a reference value.

12. (New) The remote station apparatus of claim 1, wherein the link quality estimate is an  
SNR.
